SMALL IS THE NEW

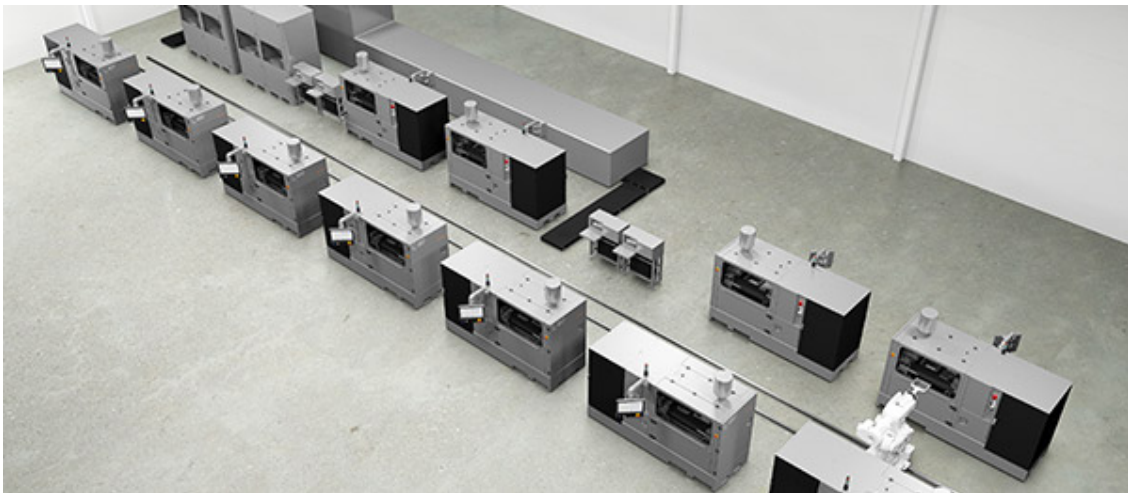

BIG

IN ADDITIVE MANUFACTURING

No 1, 2019

A newsletter from Digital Metal® about the possibilities within high-precision binder jetting

Our printer is now certified by UL

Digital Metal® has received notice of completion of product testing and authorization to apply the UL ([Underwriters Laboratories](#)). Mark to our metal binder-jetting system DM P2500. This certification proves that our printer meets all the expected safety standards for the US and Canadian markets. The DM P2500 is the world's first metal binder-jetting system to receive this important certification.

Pre-launch of two new materials

During MIM 2019, the International Conference on Injection Molding of Metals, Ceramics and Carbides, held in Orlando, Florida, between 25 and 27 February, Digital Metal will show two new materials that will be officially launched during Q2.

- Inconel 625 – an alloy for high-temperature applications in industries such as automotive and aerospace
- MAR 247 – a super-alloy for high-temperature applications. Since MAR 247 is non-weldable it is not suitable for component production using traditional metal layering such as SLM. However, the complexity of the material fits well with binder jetting and Digital Metal's production technique.

Digital Metal – Big in Japan

Between January 30 - February 1, 2019, Japan hosted the TCT exhibition, aiming to accelerate the adoption of additive manufacturing and 3D printing technology in the Japanese market. A week later, those interested in 3D printing were welcomed at the DMS, also held in Tokyo, Japan. Digital Metal participated in both events for the 4th consecutive year. We can clearly see a steadily growing interest for additive manufacturing in Japan with customers placing very high demands on resolution and surface finish.
